ABSTRAK

Di masa ini, penggunaan energi konvensional sudah menjadi kebutuhan primer terutama untuk pembangkit listrik di Indonesia yang masih mengandalkan batu bara, minyak, dan gas. Akan tetapi, penggunaan energi konvensional secara terus-menerus dapat mengakibatkan kerusakan pada iklim dunia dan suatu saat energi tersebut akan habis. Untuk mengatasi permasalahan tersebut, penggunaan energi terbarukan dapat menjadi alternatif untuk dikembangkan mengingat energi tersebut merupakan energi yang ramah lingkungan dan tersedia secara terus-menerus dari alam. Untuk memutuskan sumber daya energi terbarukan yang cocok untuk suatu wilayah, dapat menggunakan analisis teknno-ekonomi sebagai metode yang bisa memperhitungkan perancangan sistem energi terbarukan dari segi teknis dan ekonomis untuk penerangan di gedung rumah sakit. Dalam penelitian ini terdapat satu alternatif energi terbarukan yaitu menggunakan energi matahari. Untuk melakukan perancangan sistem energi terbarukan tersebut digunakan perangkat lunak *Hybrid Optimization of Multiple Energy Resources* (HOMER). Hasil optimasi yang dilakukan oleh HOMER untuk penerangan di gedung rumah sakit dengan bantuan analisis teknno-ekonomi menghasilkan konfigurasi sistem *off-grid/hybrid* yang terdiri atas PV-Grid-Konverter-Baterai dengan Net Present Cost (NPC) sebesar Rp. 197,252,600,- dengan harga energi per-kWh atau *cost of energy* (CoE) sebesar Rp. 423,40/kWh dan sistem ini dapat memproduksi energi listrik sebesar 21.981 kWh/tahun. Dengan demikian penggunaan analisis teknno-ekonomi dapat dilakukan untuk pengembangan penelitian terkait sistem energi terbarukan.

Kata kunci : Sistem energi terbarukan, energi matahari, analisis teknno-ekonomi, optimasi sistem energi terbarukan, NPC, CoE

ABSTRACT

In this era, the use of conventional energy has become a primary necessity, especially for power generation in Indonesia, which still relies on coal, oil, and gas. However, the continuous use of conventional energy can lead to climate damage globally, and eventually, these energy sources will deplete. To address this issue, the utilization of renewable energy can serve as an alternative to develop, considering that these sources are environmentally friendly and continuously available from nature. To determine suitable renewable energy resources for a specific region, techno-economic analysis can be employed as a method that considers both technical and economic aspects of designing renewable energy systems, particularly for hospital building lighting. In this research, one renewable energy alternative is solar energy. To design such a renewable energy system, the Hybrid Optimization of Multiple Energy Resources (HOMER) software is used. The optimization results conducted by HOMER for hospital building lighting, aided by techno-economic analysis, yield an off-grid/hybrid system configuration consisting of PV-Grid-Converter-Battery with a Net Present Cost (NPC) of Rp. 197,252,600,- and a cost of energy (CoE) of Rp. 423.40/kWh. This system can generate electrical energy amounting to 21,981 kWh/year. Consequently, the utilization of techno-economic analysis can be applied to the development of research related to renewable energy systems.

Keywords : Renewable energy systems, solar power, techno-economic analysis, optimization of renewable energy, NPC, CoE
