## KATA PENGANTAR

Puji syukur penulis panjatkan ke hadirat Allah Subhanahu wa Ta'ala atas limpahan rahmat, karunia, kasih sayang, serta ridho-Nya, sehingga penulis dapat menyelesaikan penyusunan skripsi dengan judul: Pengembangan Komposit Nanoselulosa dari Alga Cokelat (*Sargassum duplicatum*) Terfungsionalisasi TiO<sub>2</sub> untuk Fotodegradasi Limbah Antibiotik. Shalawat dan salam senantiasa tercurah kepada junjungan Nabi Muhammad Saw., beserta keluarga, sahabat, dan para pengikut beliau hingga akhir zaman. Dengan izin dan pertolongan Allah, segala daya dan upaya yang penulis lakukan dimudahkan hingga terselesaikannya skripsi ini. Dalam kesempatan ini, penulis ingin menyampaikan ucapan terima kasih yang sebesar-besarnya kepada berbagai pihak yang telah memberikan bantuan, bimbingan, dan dukungan, baik secara langsung maupun tidak langsung, selama proses penelitian dan penulisan skripsi ini, yaitu:

1. Kedua orang tua tercinta, beserta adik, yang senantiasa memberikan doa, kasih sayang, serta dukungan moral dan material.
2. Prof. Dr. Hendrawan, M.Si. dan Athanasia Amanda Septevani, S.T., Ph.D., selaku dosen pembimbing, atas segala arahan, masukan, dan dukungan selama penelitian hingga penyusunan skripsi.
3. Prof. Fitri Khoerunnisa, Ph.D., selaku Ketua Program Studi Kimia FPMIPA UPI sekaligus pembimbing akademik, atas segala arahan dan bimbingan yang telah diberikan.
4. Dr. Nadiatus Silmi, S.Si., M.Si. dan Fitra Yurid, S.Si., M.T., selaku senior, atas bantuan dan arahan selama pelaksanaan penelitian.
5. Rekan-rekan di Laboratorium Sistem Elektronika Cerdas Berkelanjutan yang telah kebersamai, membimbing, serta membantu penulis beradaptasi di lingkungan laboratorium.
6. Sahabat seperjuangan: Zena, Fajar, George, dan Arfan, yang selalu memberikan semangat dan dukungan selama perkuliahan.
7. Teman-teman KMNU UPI angkatan 2021 atas kebersamaan, dukungan, dan motivasi yang diberikan.

8. Semua pihak yang tidak dapat penulis sebutkan satu per satu, namun telah banyak membantu dalam kelancaran penelitian dan penyusunan skripsi ini.

Penulis menyadari bahwa skripsi ini masih jauh dari sempurna. Oleh karena itu, kritik dan saran yang membangun sangat penulis harapkan demi perbaikan di masa mendatang. Semoga skripsi ini dapat memberikan manfaat serta menjadi kontribusi kecil dalam pengembangan ilmu pengetahuan, khususnya di bidang kimia material berkelanjutan.

Bandung, Agustus 2025

Penulis

## ABSTRAK

Limbah medis, khususnya kontaminan farmasetik seperti antibiotik, menjadi ancaman lingkungan yang serius karena sifatnya yang persisten di perairan dan potensi mengganggu keseimbangan ekosistem. Metode pengolahan air limbah konvensional seperti koagulasi dan sedimentasi sering kali tidak mampu menghilangkan polutan farmasetik secara efektif, sehingga diperlukan metode lanjutan. Pencemaran antibiotik di lingkungan perairan dapat menyebabkan akumulasi biologis dan resistensi genetik. Fotokatalisis sebagai bagian dari Advanced Oxidation Processes (AOPs) merupakan metode yang efektif dan ramah lingkungan untuk mendegradasi senyawa tersebut. Penelitian ini bertujuan untuk mengisolasi nanoselulosa dari biomassa alga cokelat *Sargassum duplicatum*, mengembangkan komposit nanoselulosa-TiO<sub>2</sub> dalam bentuk film, serta menguji aktivitas fotokatalitiknya terhadap antibiotik. Selulosa berhasil diisolasi dengan rendemen tertinggi 56,55% pada perlakuan NaClO<sub>2</sub> 5% (3 jam), kemudian dihidrolisis menjadi nanoselulosa (CNC) dengan morfologi batang (rod-like), diameter rata-rata  $11,19 \pm 3,52$  nm, panjang  $816,36 \pm 184,05$  nm, rasio aspek 72,93, dan kristalinitas meningkat dari 45,39% menjadi 59,64%. Analisis FTIR menunjukkan adanya gugus sulfat ester ( $1050\text{ cm}^{-1}$ ), sedangkan TEM menegaskan bentuk rod-like CNC. Komposit optimum diperoleh pada rasio 3:1 (NC:TiO<sub>2</sub>). Karakterisasi SEM-EDS menunjukkan TiO<sub>2</sub> terdispersi homogen tanpa aglomerasi besar, dengan kandungan unsur utama O (49,44%), C (37,00%), dan Ti (13,56%). Pola XRD menegaskan keberadaan fase anatase TiO<sub>2</sub> ( $25,3^\circ 2\theta$ ) serta selulosa I $\beta$  ( $16^\circ$  dan  $22,6^\circ 2\theta$ ), sementara UV-Vis DRS memperlihatkan penurunan band gap dari 2,99 eV (TiO<sub>2</sub> murni) menjadi 2,63 eV pada komposit. Uji fotokatalitik menunjukkan kinerja komposit lebih baik dibanding TiO<sub>2</sub> murni maupun nanoselulosa tunggal. Efisiensi degradasi mencapai 94,83% untuk rifampisin dan 90,83% untuk amoksisilin, lebih tinggi dibandingkan TiO<sub>2</sub> murni (80,26% dan 79,26%). Optimasi dosis katalis menunjukkan hasil terbaik pada 5 g/L, sedangkan uji reusabilitas hingga siklus ketiga masih mempertahankan efisiensi cukup baik, yaitu 88,35% (RIF) dan 72,10% (AMX). Analisis kinetika menegaskan bahwa reaksi degradasi mengikuti model orde pertama. Hasil ini menunjukkan bahwa komposit nanoselulosa-TiO<sub>2</sub> berpotensi sebagai fotokatalis berkelanjutan untuk pengolahan limbah antibiotik di lingkungan perairan.

**Kata Kunci:** Nanoselulosa, TiO<sub>2</sub>, Fotokatalisis, Antibiotik, *Sargassum duplicatum*

## ABSTRACT

Medical waste, particularly pharmaceutical contaminants such as antibiotics, poses a serious environmental threat due to their persistence in aquatic systems and potential disruption of ecosystem balance. Conventional wastewater treatment methods such as coagulation and sedimentation are often ineffective in removing pharmaceutical pollutants, thus requiring advanced treatment strategies. Antibiotic pollution in aquatic environments can lead to bioaccumulation and genetic resistance. Photocatalysis, as part of Advanced Oxidation Processes (AOPs), is an effective and environmentally friendly method for degrading such compounds. This study aimed to isolate nanocellulose from the brown algae *Sargassum duplicatum*, develop nanocellulose–TiO<sub>2</sub> composites in film form, and evaluate their photocatalytic activity against antibiotics. Cellulose was successfully isolated with the highest yield of 56.55% under NaClO<sub>2</sub> 5% treatment (3 h), then hydrolyzed into nanocellulose (CNC) with rod-like morphology, an average diameter of  $11.19 \pm 3.52$  nm, length of  $816.36 \pm 184.05$  nm, aspect ratio of 72.93, and crystallinity increased from 45.39% to 59.64%. FTIR analysis revealed sulfate ester groups ( $1050\text{ cm}^{-1}$ ), while TEM confirmed the rod-like shape of CNC. The optimum composite was obtained at a 3:1 ratio (NC:TiO<sub>2</sub>). SEM-EDS analysis showed well-dispersed TiO<sub>2</sub> without large agglomeration, with the main elements O (49.44%), C (37.00%), and Ti (13.56%). XRD patterns confirmed the presence of anatase TiO<sub>2</sub> ( $25.3^\circ 2\theta$ ) and cellulose I $\beta$  ( $16^\circ$  and  $22.6^\circ 2\theta$ ), while UV-Vis DRS demonstrated a reduction in band gap from 2.99 eV (pure TiO<sub>2</sub>) to 2.63 eV in the composite. Photocatalytic tests revealed that the composite outperformed pure TiO<sub>2</sub> and nanocellulose alone. Degradation efficiencies reached 94.83% for rifampicin and 90.83% for amoxicillin, higher than pure TiO<sub>2</sub> (80.26% and 79.26%). Catalyst dose optimization indicated the best performance at 5 g/L, while recyclability tests up to three cycles retained good efficiency, with 88.35% (RIF) and 72.10% (AMX) in the third cycle. Kinetic analysis confirmed that the degradation reaction followed a first-order model. These findings indicate that nanocellulose–TiO<sub>2</sub> composites have strong potential as sustainable photocatalysts for antibiotic wastewater treatment in aquatic environments.
