

CHAPTER III

METHODOLOGY

A. Research Method and Design

1. Research Method

As the objective of this research is to investigate the effect of levels of inquiry implementation to students' scientific inquiry skills' achievement and how to best implementing levels of inquiry in facilitating the students to master scientific inquiry skills, the method used in this research is quantitative-descriptive method as it was stated in Creswell (2009). This research was conducted in one of state junior high school in Bandung, Indonesia, which will be named as junior high school X. The research was conducted on September 2014. Control variables included in the research were in form of pretest and posttest item test and sampling. Some covariates might be included as one of alternative in explaining problem resulted by confound.

2. Research Design

Based on the research method used in this research and adjusted to the objectives o the reseach, the design of this research was one-group pretest-posttest design (Gay, *et.al.*, 2009), in which involving a single group being tested (pretest), participated in certain treatment, and ended by being tested again (posttest). The single group would have been tested as parameter for

achievement difference after being intervened by Levels of Inquiry implementation on classification of Plantae Kingdom. The single group would have been tested at the end of treatment and thus, the result of the second test would have been compared with the preliminary test in measuring the significance difference of students' achievement after teaching and learning process.

Table 3.1 Scheme of One-Group Pretest-Posttest Design

| Sample | Measure or Observation | Treatment | Measure or Observation |
|--------|------------------------|----------------|------------------------|
| A | O ₁ | X ₁ | O ₂ |

O₁ : Pretest of students' science inquiry skill

X₁ : Treatment implementation, which is teaching by *Levels of Inquiry* on topic of classification of plant

O₂ : Posttest of students' science inquiry skill

In establishing the research, the procedure is divided into 3 parts, which are preparation stage, implementation stage, and final stage.

- a. The preparation stage is including preliminary study such as literature review about Levels of Inquiry, Scientific Inquiry Skill, and curriculum point of view regarding their urgency to be implemented, designing and arranging research, and constructing the instrument. Validation of instrument as well as checking its reliability and training the teacher about how the treatment should be implemented.

- b. The implementation stage is including the implementation of Levels of Inquiry starting from preliminary observation and measurement until the data collection.
- c. The final stage will be the data analysis as well as verifying hypothesis of research.

The plan of research flow is stated as below:

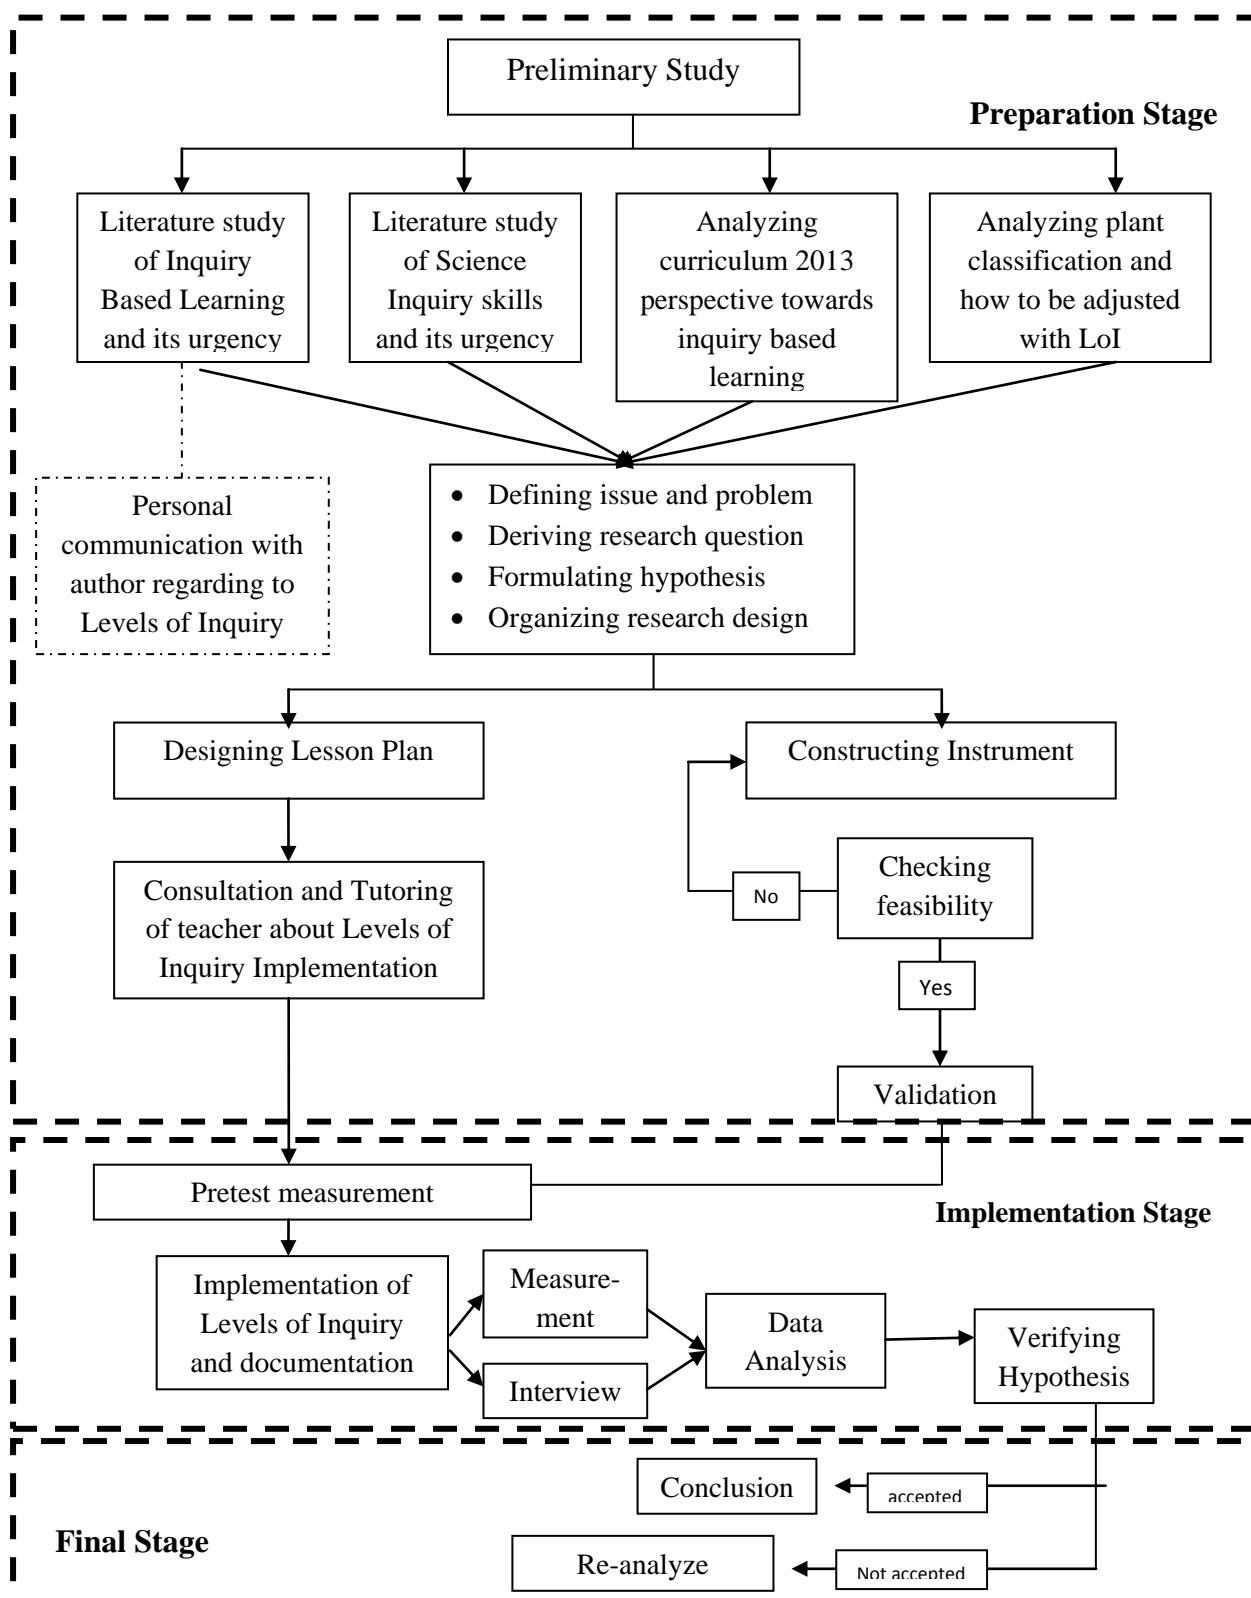

Figure 3.1. Scheme of Research

B. Subject of Research

Population can be defined as any size that may cover any geographic area or certain group as a whole that interests the researcher (Gay, *et.al*, 2009). The population that used in data is in form of accessible population which was taken from all 7th grade students of junior high school X, Bandung

Based on population, sample was taken by using purposive sampling, which is a process of selecting participant of research that is believed to represent chosen population in general (Gay, *et.al*, 2009). As much as 29 students of seventh graders were taken as the sample of the research. The sample was taken based on consultation with science teacher, whom was the subject of experiment treatment, considering to make it as homogenous sample and representative for data collection.

C. Operational Definition

1. *Levels of Inquiry*

This term refers to a learning spectrum proposed by Carl J Wenning in 2004, which in this term refers to levels of discovery learning, where students are expected to discover a science phenomenon; interactive demonstration, where students are shown a demonstration regarding to that phenomenon; inquiry lesson, where students are expected to analyze the demonstration and predict the variables related to that phenomena; and inquiry lab, where students are expected to manipulating variables.

2. *Scientific inquiry skills*

Science inquiry skills in this research will refer to stages of inquiry as stated by Carl J. Wenning in 2007, which in this term refer to 6 of 9 skills which defines scientific inquiry skills as part of scientific literacy.

3. *Achievement*

Achievement in this research paper refers to the improvement of students' test when the result of pretest is being compared with posttest result. The mean comparison, average normalized gain, and t-test result will be indicators of students' achievement.

D. Research Instruments

The instruments used in this research were made in order to get relevant data. A series of pretest, posttest, observation sheet as well as its rubric were the instruments used during research implementation

1. Pre- test

A set of instrument was developed by adapting the scientific inquiry skills item test made by Wenning in 2007 into 18 scientific inquiry skills' item tests. The item test will be adapted to topic of classification of plant. Yet, the content burden was not being highlighted since the item tests were made so that the scientific inquiry skills would be the one which is assessed instead of the content coverage of the item test. The item tests were made in form of multiple choices since it is expected to get clearer data as well as easier in the statistical analysis of the result.

Pretest is a test given before the treatment is implemented. It was given before the teacher starts with the first level of inquiry which discovery

learning. The pretest given had been validated to other participant as the preparation stage of the instrument until the blueprint was fixed to be used.

A blueprint of instrument was made in order to get a clear separation among the weight of each skill along with the topic that should cover it. The blueprint of instrument was made and provided as below:

Table 3.2 Blueprint of Instrument

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|--|---|----------------------------------|------------------------------|-------------------------------------|--|--|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae : Monocots and its classification | Angiospermae : Dicots and its classification | |
| Identify a problem to be investigated | 1 | 7 | 13 | | | 34 | 4 |
| Using induction, formulate a hypothesis or model incorporating logic and evidence | | 8, 9 | | | 26 | 35 | 4 |
| Using deduction, generate a prediction from the hypothesis or model | 2 | 10 | | | 27 | 36 | 4 |
| Design experimental procedures to test the prediction | 3 | 11 | 14 | 19 | | | 4 |
| Conduct a scientific experiment, observation, or stimulation to test the hypothesis or model: - Identify the experimental | 4 | | | 20 | 28 | 37 | 4 |

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|---|---|----------------------------------|------------------------------|-------------------------------------|--|--|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae : Monocots and its classification | Angiospermae : Dicots and its classification | |
| system | | | | | | | |
| Conduct a scientific experiment, observation, or stimulation to test the hypothesis or model: - Identify and define variables operationally | | 12 | 15 | 21 | 29 | | 4 |
| Conduct a scientific experiment, observation, or stimulation to test the hypothesis or model: - Conduct a controlled experiment or observation | 5 | | 16 | 22 | 30 | | 4 |
| Explain any unexpected results: - Formulate an alternative | | | 17 | 23 | 31 | 38 | 4 |

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|---|---|----------------------------------|------------------------------|-------------------------------------|--|--|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae : Monocots and its classification | Angiospermae : Dicots and its classification | |
| hypothesis or model if necessary | | | | | | | |
| Explain any unexpected results: - Identify and communicate sources of unavoidable experimental error | 6 | | | 24 | 32 | | 4 |
| Explain any unexpected results: - Identify possible reasons for inconsistent results such as sources of error or uncontrolled conditions | | | 18 | 25 | 33 | 39 | 4 |
| | 6 | 6 | 6 | 7 | 8 | 6 | 39 |

2. Posttest

Posttest is basically a set of question which is the same as with pretest, yet posttest was given after the treatment was conducted. The questions tested were identical and had the same amount of item test which were 18 item tests. Yet, on the testing process, the number order of the item test is randomly shuffled in order to decrease the risk of students not giving maximum effort since knowing that the item test used were identical with the preliminary test.

3. Observational Sheet

The observational sheet was a module given to the observers to observe whether the teacher maintained the activity during classroom activity according to the lesson that had been planned. There are two types of observational sheet package, they are:

a. The observation sheet I

It is aimed to observe whether the levels of inquiry had been delivered wholly and according to lesson plan. In other words, it is an observation sheet to see the suitability between lesson plan and the reality in classroom activity.

b. The observation sheet II

The observation sheet II was basically adopted from learning sequence scoring rubric created by Wenning (2004), yet in this observation it focused on the achievement of students' intellectual skills per level.

4. Rubric for observational sheet

a. Observation sheet I

Each point will be given 1 for every activity conducted and 0 for every activity missed. The result will be calibrated so the result will be in percentage

$$Score = \frac{\text{points gained}}{\text{maximum points}} \times 100\%$$

b. Observation sheet II

Each category will be given scale 1-4 as 1 was representing poor and 4 were for excellent. The total score gained will be calibrated so the result will be in percentage.

$$Score = \frac{\text{points gained}}{\text{maximum points}} \times 100\%$$

E. Instrument Validation

A good instrument is the one which can be valid and reliable as it is used for research purpose. Series of preparation had been set and done in order to ensure that the instrument used during data collection stage was valid and reliable.

The instrument of pretest as well as posttest was validated to a class of 9th grader in one of junior high school Y in Bandung. The test was validated to total 28 participants and being analyzed by the help of ANATES software program. The result from ANATES was then being judged and consulted with 2 experts to be revised.

1. Validation

Validation is a measurement in proving whether a set of instrument is valid to be used as research purpose by seeing the level of its validity if it was high or low (Arikunto, 2010). The formula used in measuring instrument's validity was using Pearson correlation product moment formula, which was stated as below:

$$r_{xy} = \frac{N \sum XY - (\sum X)(\sum Y)}{\sqrt{\{N \sum X^2 - (\sum X)^2\} \{N \sum Y^2 - (\sum Y)^2\}}}$$

With the category such as below:

Table 3.3 Validity Interpretation

| Correlation Coefficient | Validity Criteria |
|--------------------------------|--------------------------|
| $0,80 < r < 1,00$ | Very high |
| $0,60 < r < 0,80$ | High |
| $0,40 < r < 0,60$ | Enough |
| $0,20 < r < 0,40$ | Low |
| $0,00 < r < 0,20$ | Very low |

(Arikunto, 2010)

2. Reliability

Reliability is defined as how good an instrument and dependable enough to be used in data collecting since a good instrument will have no tendency and steady while being used as an instrument (Arikunto, 2010). It is possible that an instrument can be valid yet unreliable and vice versa. Thus, the reliability and validity test are a package that cannot be separated and the key of how good and bad an instrument is. Reliability can be categorized into such category as below

Table 3.4 Reliability Interpretation

| Correlation Coefficient | Reliability Criteria |
|--------------------------------|-----------------------------|
| $0,80 < r < 1,00$ | Very high |
| $0,60 < r < 0,80$ | High |
| $0,40 < r < 0,60$ | Enough |
| $0,20 < r < 0,40$ | Low |
| $0,00 < r < 0,20$ | Very low |

(Arikunto, 2010)

3. Level of difficulty

Level of difficulty or item difficulty is a total number in percentage of students who answered the questions correctly (Adams & Wieman, 2010). As it is stated in Adams & Wieman (2010) journal, the wider the range of level of difficulty, the instruments can assess wider range of students' level of mastery on something that was being assessed. The level of difficulty can be categorized as below:

Table 3.5 Level of Difficulty Interpretation

| Value | Criteria |
|-------------|-----------|
| 0,00 – 0,29 | Difficult |
| 0,30 – 0,69 | Medium |
| 0,70 – 1,00 | Easy |

(Arikunto, 2010)

4. Discriminating power

Discriminating power or discriminating index is a measurement to differentiate the upper and lower group in class, by judging how lower students would highly deceived by the option while the upper one will be able to answer the question correctly (Adams & Wieman, 2010). Discriminating power is usefull in identifying some important questions that usually tricks the knowledge of the students by the options. The discriminating power can be categorized as below:

Table 3.6 Discriminating Power Interpretation

| Value | Criteria |
|-------------|-----------|
| 0,00 – 0,20 | Bad |
| 0,20 – 0,40 | Enough |
| 0,40 – 0,70 | Good |
| 0,70 – 1,00 | Very good |

(Arikunto, 2010)

As the instrument being validated, the instrument was judged by two different experts and thus being calculated and selected in order to get a set of instrument to test scientific inquiry skills. The result of validation and judgment were presented as below:

Table 3.7 Recapitulation of Instrument Validation

| No | Validity | Reliability | Level of Difficulty | Discriminating Power | Information |
|----|----------|-------------|---------------------|----------------------|-----------------------|
| 1 | 0.254 | 0,29 | 67.86 | 25.00 | Taken, revised |
| 2 | 0.324 | | 10.71 | 25.00 | Taken, revised |
| 3 | 0.162 | | 64.29 | 25.00 | Taken, revised |
| 4 | 0.205 | | 14.29 | 12.50 | Taken, revised |
| 5 | 0.106 | | 35.71 | 25.00 | Disposed |
| 6 | 0.205 | | 21.43 | 25.00 | Disposed |
| 7 | 0.074 | | 60.71 | 12.50 | Disposed |
| 8 | 0.375 | | 21.43 | 37.50 | Taken, revised |
| 9 | 0.220 | | 32.14 | 25.00 | Taken, revised |
| 10 | 0.281 | | 53.57 | 50.00 | Taken, revised |
| 11 | 0.061 | | 10.71 | 12.50 | Disposed |
| 12 | 0.432 | | 21.43 | 37.50 | Taken, revised |
| 13 | 0.145 | | 32.14 | 12.50 | Disposed |
| 14 | 0.395 | | 32.14 | 37.50 | Taken, revised |
| 15 | 0.320 | | 32.14 | 50.00 | Taken, revised |
| 16 | 0.173 | | 17.86 | 25.00 | Disposed |
| 17 | 0.136 | | 10.71 | 0.00 | Disposed |
| 18 | -0.195 | | 67.86 | -25.00 | Invalid |
| 19 | 0.461 | | 21.43 | 50.00 | Taken, revised |
| 20 | 0.447 | | 17.86 | 37.50 | Disposed |
| 21 | 0.093 | | 46.43 | 0.00 | Disposed |
| 22 | 0.098 | | 10.71 | 12.50 | Disposed |
| 23 | 0.290 | | 21.43 | 25.00 | Taken, revised |
| 24 | -116 | | 53.57 | -25.00 | Invalid |
| 25 | -186 | | 35.71 | -12.50 | Invalid |

| No | Validity | Reliability | Level of Difficulty | Discriminating Power | Information |
|----|----------|-------------|---------------------|----------------------|-----------------------|
| 26 | 0.275 | | 7.14 | 12.50 | Taken, revised |
| 27 | -0.062 | | 14.29 | -12.50 | Invalid |
| 28 | 0.111 | | 28.57 | 12.50 | Disposed |
| 29 | 0.690 | | 35.71 | 75.00 | Taken, revised |
| 30 | 0.225 | | 57.14 | 12.50 | Disposed |
| 31 | 0.155 | | 35.71 | 12.50 | Disposed |
| 32 | 0.517 | | 21.43 | 50.00 | Taken, revised |
| 33 | 0.332 | | 39.29 | 50.00 | Taken, revised |
| 34 | 0.094 | | 7.14 | 0.00 | Disposed |
| 35 | 0.098 | | 10.71 | 12.50 | Taken, revised |
| 36 | 0.410 | | 7.14 | 25.00 | Taken, revised |
| 37 | -0.095 | | 14.29 | -12.50 | Invalid |
| 38 | -0.259 | | 35.71 | -25.00 | Invalid |
| 39 | 0.295 | | 17.86 | 37.50 | Disposed |

Based on the result presented above, a set of pretest-posttest questions were being determined, which was drawn in matrix such as below:

Table 3.8 Set of Pretest-Posttest Item Test

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|---|---|----------------------------------|------------------------------|-------------------------------------|---|---|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae: Monocots and its classification | Angiospermae: Dicots and its classification | |
| Identify a problem to be investigated | 1 | 2 | 3 | | | | 3 |
| Using induction, formulate a hypothesis or model incorporating logic and evidence | | 4, 5 | | | 6 | | 3 |
| Using deduction, generate a prediction from the hypothesis or model | 7 | | | | | 8, 9 | 3 |
| Design experimental procedures to test the prediction | 10 | 11 | 12 | | | | 3 |
| Conduct a scientific experiment, observation, or stimulation to test the hypothesis or model: - Identify the experimental system | | | | 13 | | | 1 |
| Conduct a scientific experiment, | | | | | 14 | | 1 |

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|---|---|----------------------------------|------------------------------|-------------------------------------|---|---|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae: Monocots and its classification | Angiospermae: Dicots and its classification | |
| observation, or stimulation to test the hypothesis or model: - Identify and define variables operationally | | | | | | | |
| Conduct a scientific experiment, observation, or stimulation to test the hypothesis or model: - Conduct a controlled experiment or observation | | | | 15 | | | 1 |
| Explain any unexpected results: - Formulate an alternative hypothesis or model if necessary | | | | 16 | | | 1 |
| Explain any unexpected results: - Identify and | | | | | | 17 | 1 |

| Scientific Inquiry Skills' Measured | Learning Topic | | | | | | Total |
|---|---|----------------------------------|------------------------------|-------------------------------------|---|---|-------|
| | General Classification of Living Things | Liverwort and its classification | Ferns and its classification | Gymnospermae and its classification | Angiospermae: Monocots and its classification | Angiospermae: Dicots and its classification | |
| communicate sources of unavoidable experimental error | | | | | | | |
| Explain any unexpected results: - Identify possible reasons for inconsistent results such as sources of error or uncontrolled conditions | | | | | 18 | | 1 |
| Total | 3 | 4 | 2 | 3 | 3 | 3 | 18 |

F. Data Collection

The research was conducted on September 2014 in junior high school X, Bandung. The data gathered including the result of pretest and posttest instrument, the observation sheet, video recording, and the result of interview with the teacher through voice recording. The data was collected as it was planned and according to the research scheme that has been planned.

G. Data Analysis Technique

1. Analysis of pretest and posttest result

a. Scoring process

Each of item tests is given weigh of one for each correct item test and zero for every wrong answer. The total score gained will be calibrated so that it can be presented in percentage, using formula such below:

$$Score = \frac{\text{points gained}}{\text{maximum points}} \times 100\%$$

The result of the scoring process will become raw data for calculating the score of average normalized gain and mean comparison. Besides, the data analyzed here would be processed to statistical analysis by using the aid of SPSS software program in order to prove the hypothesis made previously and to determine the significance of the students' improvement.

b. Average normalized gain

Average Normalized Gain is used as the method in analyzing the data of students' pretest and posttest. As it is stated by Hake in Saraswati (2013), average normalized gained is evocative in evaluating the effectiveness of course delivered in classroom activities. The small number of participant and aim of research as to see the effect of

Levels of Inquiry implementation on students' achievement will make average normalized gained a perfect method in analyzing the main data. The average normalized gained is described in formula as below:

$$g = \frac{\%Post\ test\ score - \%pretest\ score}{maximum\ score - \%pretest\ score}$$

(Hake in Saraswati, 2013)

The students will be tested by pre-test to see how their preliminary science inquiry skills before treatment. The students will get the treatment which is the teaching and learning process of plant's classification by using Levels of Inquiry and they will be tested which is called as posttest.

The average normalized gain is categorized into three. Based on Hake in Tanahoung *et.al* (2006), the three category of average normalized gain are:

Table 3.9 Normalized gain category

| Score of <g> | Category |
|-----------------|----------|
| > 0.7 | High |
| 0.3 > <g> > 0.7 | Medium |
| < 0.3 | Low |

2. Observation Analysis

The result of observation sheet will become the supportive data which explains the result of statistical measurement by using one simple t-test measurement and average normalized gain. The result of the observation sheet analysis would also help in determining the relation among skills which are mastered the most by the students and the thing happened during classroom activity.

3. Interview analysis

Interview is also one of optional data which was gathered so the researcher would consider the obstacle experienced by the teacher as the subject who experienced the treatment.
