# CHAPTER III RESEARCH METHODOLOGY

#### **3.1 Research Method**

This research was conducted use quantitative research method. The researcher identifies a research problem in quantitative research based on trends in the field or the desire to explain why something happens (Creswell, 2012b). Quantitative Research Methods can be used in both intervention and non-intervention studies. Intervention research usually has a goal of explaining the impact of intervention on two opposing groups. While research without intervention may explain the relationship between two variables in one group of subjects based on the pattern observed, or describe the tendency of a population, research with intervention may explain the relationship between two variables in another group of subjects based on the pattern observed. The method also collects data using an instrument with questions and replies that may be measured or witnessed. After then, the data will be examined using statistical processes (Creswell, 2012a). This research include to the non-intervention research.

The research design used is survey research design. According to Creswell (2012), in survey research design, the researcher must administer a survey to a sample to describe the population's views, beliefs, behaviors, or traits. The survey design may be appropriate since it considers all of the procedures needed in conducting a survey on a phenomenon to be examined (Kothari, 2004).

Survey research entails using instruments such as interview questions, questionnaires, and tests to describe the characteristics of a group (Fraenkel, Wallen & Hyun, 2011). Students' performances in scientific attitude domains and scientific literacy aspects were profiled using two instruments in the form of a written test. The information was gathered using Google Form, an online survey platform.

### **3.2 Population and Sample**

The population can be describing as members of the human race, animal, events, or entity that reside together in one location and deliberately become the final focus of the results of the analysis. This research used stratified random sampling. In stratified sampling, researchers divide (stratify) the population based on a given attribute (e.g., gender) and then take a sample from each subset (stratum) of the population using simple random sampling (e.g., females and males). This ensures that the sample contains specific traits that the researcher desires (Creswell, 2012a).

The target population of this research is 9th grade of junior high school students from private school in Bandung City and public school in Kuningan. As the aim of this research to describe the scientific attitude and scientific literacy of 9<sup>th</sup> grade junior high students on Learning biotechnology. The limitation of access for the entire 9<sup>th</sup> grade of junior high school students from private schools in Bandung City makes the researcher decide to take the sample. All of the schools are officially accredited A and use the Indonesian National Curriculum.

In the stratified random sampling for this study, the first stratum of the selected research sample is focused on high school students. The second stratum, grade 9, was chosen to be more specific. For the third stratum, not all of the samples in schools in this study were taken, they were taken randomly.

The total of 171 students were involved in this research with an age average 13-14 years old. The distribution participant shown in Table 3.1

| Participant Distribution |         |        |                       |            |
|--------------------------|---------|--------|-----------------------|------------|
| Population               | School  | Gender | Number of<br>Students | Percentage |
|                          | Private | Male   | 57                    | 33.33%     |
| 9 <sup>th</sup> grader   | FIIVale | Female | 45                    | 26.32%     |
|                          | Dublic  | Male   | 30                    | 17.54%     |
|                          | Public  | Female | 39                    | 22.81%     |

### 3.3 Operational Definition

The operational definitions of this research were explained in order to avoid misunderstandings and misconceptions in this research. The operational definitions of this research are as follows:

1) Scientific Attitude

In this research, Scientific Attitude defined as an attitude that consists of five aspects; curiosity, objectivity, critical thinking, open-mindedness, and perseverance to be measured.

2) Scientific Literacy

A test with 25 multiple-choice questions and a questionnaire are used to determine scientific literacy. The Learning biotechnology is used in the test. The questions are mostly delivered through articles, photos, and graphs. The test is conducted in Bahasa in order to reach a large number of possible respondents. It is distributed to students via the internet. Using IBM SPSS Statistics 25 and Microsoft Excel, a descriptive analysis is carried out to generate findings.

# 3.4 Research Instrument

Scientific Attitude domain and Scientific Literacy aspects are measured using two types of research instruments. All of the results are then added together to determine the students' scientific attitude and literacy. Table 3.2 shows the instruments that were used to carry out this research.

| Data                          | Instrument                    |
|-------------------------------|-------------------------------|
| Students' scientific attitude | Questionnaire                 |
| Students' scientific literacy | Scientific literacy test, and |
|                               | questionnaire                 |

Table 3.2 The List of Research Instrument

### 3.4.1 Students' Scientific Attitude

Questionnaire was used as the research instrument to assess the student's scientific attitude. The test's accessible link are, http://gg.gg/PrivateScientificAttitudeQuestionnaire,

http://gg.gg/PublicScientificAttitudeQuestionnaire. The results were then analyzed using SPSS software (version 25) to determine scientific attitude in public and private schools, as well as scientific literacy in public and private schools.

# 3.4.1.1 Questionnaire

The Scientific attitude of the students were assessed through the questionnaire that is adapted by Harlen in Fatonah & Prasetyo (2014) and Pitafi (2012). The instrument that is used in this research is the statement in questionnaire of scientific attitude. The indicators of the statements posed in the questionnaire has been adapted by the previous researcher. Table 3.3 shows the structure of the statements. Questionnaires can be self-administered or administered by a professional, they can be given individually or in groups, and they usually contain a set of items that reflect the research goals (Ponto, 2015).

| Table 3.3 |

|-----------|

# The Initial of Scientific Attitude Questionnaire

| No | Dimensions   | Indicators   | Statement<br>Number |
|----|--------------|--|---------------------|
| 1. | Curiosity    | Enthusiastically looking for answers                   | 1,2,3,4,5,6         |
|    |              | Attention to the object being                          | 7,8,9               |
|    |              | observed   | 10,11,12,13         |
|    |              | Enthusiastic about the scientific process              |                     |
| 2. | Objectivity  | Make decisions according to facts                      | 14,15,16,17         |
|    | 5 2          | No prejudice   | 18,19               |
|    |              | Do not mix facts with opinions                         | 20,21               |
| 3. | Critical     | Doubt a situation                                      | 22,23,24            |
|    | thinking     | Repeating the activities carried out                   | 25,26               |
|    | -            | Do not ignore data even if it's small                  | 27,28               |
| 4. | Open         | Respect other people's                                 | 29,30,31,32         |
|    | Mindedness   | opinions/findings                                      | 33,34,35            |
|    |              | Doesn't always feel right                              |                     |
| 5. | Perseverance | Repeating the experiment even if it results in failure | 36,37,38            |

#### 3.4.2 Students' Scientific Literacy

The competency test and the questionnaire is applied in this research to assess the students' scientific literacy. The test's accessible link are http://gg.gg/PrivateScientificLiteracyTest , http://gg.gg/PublicScientificLiteracyTest . The results were then analyzed using SPSS software (version 25) to determine scientific attitude in public and private schools, as well as scientific literacy in public and private schools. The following are the instruments' descriptions:

#### **3.4.2.1** Competency Test

Students' scientific literacy is assessed through a competency test. On the topic of biotechnology, a competency test is given. Furthermore, the competencies include scientifically explaining phenomena, evaluating and designing scientific inquiry, and scientifically interpreting data and evidence while taking into account content knowledge, procedural knowledge, and epistemic knowledge.

| No Subtopic/Knowledge<br>Competencies |  | Explain phenomena scientifically                               |                   | Evaluate and<br>design scientific<br>enquiry |           |          | Interpret data<br>and evidence<br>scientifically |           |          |                  |
|---------------------------------------|--|--|-------------------|--|-----------|----------|--|-----------|----------|------------------|
|                                       | competeners                                | С  | Р                 | Е  | С         | Р        | Е  | С         | Р        | Е                |
| 1.                                    | Biotechnology and its Development          | 27   |                   |  |           |          |  |           |          |                  |

 Table 3.4

 The Initial Blueprint of Scientific Literacy Competency Test

To make sure if the test was appropriate to be administered, the test through the reviewing by experts' stage. Three experts joined in the instrument judgment process, and then validated by testing them on students

who had already studied about the learning biotechnology, which included 85 students from various schools in the 9<sup>th</sup> with 33 students and 10<sup>th</sup> grades with 52 students. Due to distance learning, the initial test item validation is done online. The question 1 until 22 were distributed to 9<sup>th</sup> grader student, where the question number 23-34 were distributed to 10<sup>th</sup> grader student.

Students' validation scores were then evaluated using SPSS 25 to determine their validity, reliability, difficulty level, discriminating power, and distractor. The correlation between item score and total score represents the validity of test items.

#### 3.4.2.2 Questionnaire

In the attitude domain, a questionnaire is used to assess students' scientific literacy. Interest in science, valuing scientific approaches to inquiry, and environmental awareness are all factors taken into account by PISA. Using a Likert-scale, the questionnaire is based on the PISA 2015 assessment and analysis framework.

| No  | Aspects             | Indicators                           |   | Likert | Scale |   |
|-----|---------------------|--------------------------------------|---|--------|-------|---|
| INO | Aspects             | Indicators                           | 1 | 2      | 3     | 4 |
| 1.  |                     | Interest in science learning         |   |        |       |   |
| 2.  |                     | Science activities that are focused  |   |        |       |   |
|     |                     | on the future                        |   |        |       |   |
| 3.  |                     | Motivation to learn science          |   |        |       |   |
| 4.  |                     | Science's self-efficacy              |   |        |       |   |
| 5.  |                     | Continue to studies in science       |   |        |       |   |
|     | Interest in Science | outside of the school                |   |        |       |   |
| 6.  | interest in Science | Career orientation                   |   |        |       |   |
| 7.  |                     | Science career preparation in school |   |        |       |   |
| 8.  |                     | Specific careers' occupational       |   |        |       |   |
|     |                     | prestige                             |   |        |       |   |
| 9.  |                     | Out-of-School Science Experiences    |   |        |       |   |

|     |                     | explanations.                        |   |        |       |   |
| 14. |                     | Criticism is valued as a technique   |   |        |       |   |
|     |                     | of determining the validity of any   |   |        |       |   |

Table 3.5

Questionnaire on Scientific Literacy Blueprint (Attitude Domain)

|     |               | ideas.                             |
|-----|---------------|------------------------------------|
| 15. |               | Science's self-efficacy            |
| 16. |               | Environmental awareness is         |
|     |               | important                          |
| 17. |               | Environmental awareness is         |
|     |               | important                          |
| 18. | Environmental | Environmental challenges are       |
|     | Awareness     | perceived differently by different |
|     | 1 wareness    | people                             |
| 19. |               | Environmental challenges are       |
|     |               | perceived differently by different |
|     |               | people                             |
| 20. |               | Optimism about the environment     |

The Likert scale was used to measure the scientific attitude questionnaire used in this study. The Likert scale is used to measure "attitude," which is a scientifically established term (Joshi, Kale, Chandel, & Pal, 2015). The scale was stated in number from 1 to 4 which starts from strongly disagree to strongly agree.

| Table 3.6   |                   |       |  |
|---|-------------------|-------|--|
| Scientific Attitude Questionnaire on A Likert Scale |                   |       |  |
| Scale   | Criterion         | Point |  |
| 1   | Strongly disagree | 1     |  |
| 2   | Disagree          | 2     |  |
| 3   | Agree             | 3     |  |
| 4   | Strongly Agree    | 4     |  |

In scientific literacy, each scale is a condition for earning the value of the scientific attitude domain, according to Table 3.6. On a scale of one to four, the student strongly disagrees with the statement and receives one point from the determined option. The questionnaire is reviewed by experts with relevant backgrounds in education, notably in science education, to ensure that it is suitable for implementation. Expert judgment results in the form of statements, as well as the requirement for additional information. The number of statements used is still the same with the same indicators, only a few revisions have been made.

# **3.5 Data Analysis Technique** 1) Validity

A given result's validity refers to its accuracy, usefulness, appropriateness, and relevance (Fraenkel, Wallen & Hyun, 2011). This test was conducted to see if the instrument was valid and if the question was capable of measuring scientific literacy competency. SPSS is the program that was utilized in this study to determine the validity value. Table 3.5 shows the validity value interpretation. The formula for determining validity is shown below:

$$r_{xy} = \frac{n \sum xt - \{(\sum x)(\sum y)\}}{\sqrt{\{n \sum x^2 - (\sum x)^2\}\{n \sum y - (\sum y)^2\}}}$$

Known:

 $r_{xy}$  = items correlation coefficient x = items scores y = each student's total score n = the number of subjects  $\sum x$  = sum of all students' total scores for each question's item.  $\sum y$  = total score of all students on the entire test (Fraenkel, Wallen & Hyun, 2011)

The validity interpretation is shown in table 3.7 below.

| Table 3.7The Value of Validity and Its Interpretation |                             |  |
|---|-----------------------------|--|
| The amount of r value                                 | Interpretation              |  |
| $0,80 < r \le 1,00$                                   | Very high                   |  |
| $0,60 < r \le 0,80$                                   | High                        |  |
| $0,40 < r \le 0,60$                                   | Enough                      |  |
| $0,20 < r \le 0,40$                                   | Low                         |  |
| $0,00 < r \le 0,20$                                   | Very low                    |  |
|   | (Minium, King & Bear, 1993) |  |

2) Reliability

The stability, reliability, and precision of a test result are all examples of reliability. The constancy of the answer is frequently mentioned. As a result, the following formula may be used to compute the reliability:

$$a = \frac{K}{K-1} 1 - \frac{\sum_{i=1}^{K} \sigma_{Yi}^{2}}{\sigma_{x}^{2}}$$

Known:

K = items numbers

 $\sigma_x^2$  = the difference (square of standard deviation)

 $\sigma_{yi}^2$  = item variation detected

(Bonett & Wright, 2015)

| Table 3.8                              |  |  |
|--|--|--|
| Value of Reliability in Interpretation |  |  |
| Gained r value Interpretation          |  |  |
| 0,80-1,00                              | Very High                                |  |
| 0,60-0,79                              | High                                     |  |
| 0,40-0,59                              | Prosperous                               |  |
| 0,30-0,39                              | Low                                      |  |
| 0,00-0,19                              | Very low                                 |  |
|  | (Tilastoseura, Finnish, & Society, 2000) |  |

3) Difficulty Level

In this study, the difficulty level refers to the degree of difficulty in answering questions for students, not from the perspective of the teacher. The difficulty level is calculated by multiplying the number of students who properly answer questions by the total number of students who take the test (Chauhan & Bhoomika, 2013). This is the formula for determining the level of difficulty:

$$p = \frac{N}{A}$$

Known:

P = Difficulty level

A = Number of students who properly solved the item

N = Number of students who attempted the item in total

| Table 3.9<br>Difficulty Level Interpretation Value |                               |  |
|--|-------------------------------|--|
| Value of Difficulty Index                          | Interpretation                |  |
| 0,00 - 0,30  | Difficult                     |  |
| 0,30 - 0,70  | Medium                        |  |
| 0,70 - 1,00  | Easy                          |  |
|  | (Cohen Manian & Maniaan 2008) |  |

(Cohen, Manion & Morrison, 2008)

### 4) Discriminating Power

Discriminating power is used to categories things based on the likelihood of high-scoring examiners reacting correctly vs the likelihood of low-scoring examiners reacting correctly (Backhoff, Larrazolo & Rosas, 2015). Table 3.8 lists the categories of discriminating power.

#### Table 3.10

Interpreting Power in A Discriminating Power

| D Value             | Interpretation      |  |  |  |
|---------------------|---------------------|--|--|--|
| 0,00 < D ≤ 0,20     | Poor                |  |  |  |
| $0,20 < D \le 0,40$ | Satisfactory        |  |  |  |
| $0,40 < D \le 0,70$ | Good                |  |  |  |
| $0,70 < D \le 1,00$ | Excellent           |  |  |  |
| D = Negative        | Question is deleted |  |  |  |
|                     |                     |  |  |  |

(Exhcoba & Reyna, 2015)

# 5) Distractor

Distractor is a component of the option that provides an incorrect alternative option in order to distract students with the incorrect option. The amount of distractors in each question can be determined by counting the number of students who choose the incorrect answer.

### **3.6** Instrument Analysis Result

The competency test was developed in stages, beginning with the adaption of the school curriculum then continuing with expert judgment and validation. Furthermore, the objective test's validity, reliability, difficulty level (DL), discriminating power (DP), and distractor power were all employed to examine it. Following the analysis, the item reliability score was determined to be 0.68 and 0.70 indicating that it is in high category. Table 3.9 summarizes the results of the objective test analysis.

| The Recapitulation of Competency Test Analysis |          |                |                             |                  |  |  |  |
|--|----------|----------------|-----------------------------|------------------|--|--|--|
| Number   | Validity | DL (difficulty | DP (discriminating          | Acceptance       |  |  |  |
| Tumber   | v        | level)         | power)                      |                  |  |  |  |
| 1  | Enough   | Medium         | 0.50 (Good)                 | Used             |  |  |  |
| 2  | Enough   | Easy           | 0.47 (Good)                 | Used             |  |  |  |
| 3  | Low      | Easy           | 0.34 (Satisfactory)         | Used             |  |  |  |
| 4  | High     | Medium         | 0.68 (Good)                 | Used             |  |  |  |
| 5  | Very Low | Medium         | 0.14 (Poor)                 | Need revision    |  |  |  |
| 6  | Enough   | Easy           | 0.59 (Good)                 | Used             |  |  |  |
| 7  | Very Low | Easy           | 0.12 (Poor)                 | Need revision    |  |  |  |
| 8  | Low      | Medium         | 0.37 (Satisfactory)         | Used             |  |  |  |
| 9  | Low      | Medium         | 0.34 (Satisfactory)         | Used             |  |  |  |
| 10   | Enough   | Easy           | 0.42 (Good)                 | Used             |  |  |  |
| 11   | Very low | Easy           | 0.06 (Poor)                 | Need<br>revision |  |  |  |
| 12   | Enough   | Easy           | 0.44 (Good)                 | Used             |  |  |  |
| 13   | Enough   | Medium         | 0.47 (Good)                 | Used             |  |  |  |
| 14   | High     | Easy           | 0.61 (Good)                 | Used             |  |  |  |
| 15   | High     | Medium         | 0.66 (Good)                 | Used             |  |  |  |
| 16   | Low      | Difficult      | 0.28 (Satisfactory)         | Used             |  |  |  |
| 17   | Very low | Medium         | -0.53 (Question is deleted) | Rejected         |  |  |  |
| 18   | Very Low | Difficult      | 0.05 (Poor)                 | Need<br>revision |  |  |  |
| 19   | Low      | Medium         | 0.22 (Satisfactory)         | Need revision    |  |  |  |
| 20   | Low      | Medium         | 0.30 (Satisfactory)         | Need revision    |  |  |  |
| 21   | Enough   | Easy           | 0.37 (Satisfactory)         | Need revision    |  |  |  |
| 22   | Enough   | Medium         | 0.51 (Good)                 | Used             |  |  |  |
| 23   | Low      | Medium         | 0.36 (Satisfactory)         | Need revision    |  |  |  |
| 24   | Very Low | Easy           | -0.12 (Question is deleted) | Rejected         |  |  |  |
| 25   | Low      | Medium         | 0.25 (Satisfactory)         | Used             |  |  |  |
| 26   | Very Low | Easy           | 0.37 (Satisfactory)         | Used             |  |  |  |
| 27   | Low      | Medium         | 0.23 (Satisfactory)         | Used             |  |  |  |
| 28   | Very Low | Medium         | 0.16 (Poor)                 | Need revision    |  |  |  |
| 29   | Very Low | Easy           | -0.22 (Question is deleted) | Rejected         |  |  |  |

Table 3.11The Recapitulation of Competency Test Analysis

| Number | DL<br>Validity (difficulty<br>level) |        | DP<br>(discriminating<br>power) | Acceptance       |  |  |
|--------|--------------------------------------|--------|---------------------------------|------------------|--|--|

All of the questions can be utilized as competency tests after the competency exam has been analyzed, judged, and validated, but several questions require change. The final exam item utilized as a competency test after that. The revised ones are considered to be applied based on expert recommendations, competency domains, and subtopic distributions. The final test items were reduced to 25 multiple choice questions with recapitulation as follows. Appendix contains the information.

| Scientific Literacy Competency Test Blueprint (After Revision) |  |   |           |   |           |  |         |           |          |           |

### 3.7 Research Procedure

The research procedure is divided into three key stages in order to make this research effectively organized in terms of systematic. Preparation, implementation, and completion are the three primary steps, which described as follows:

1) Preparation stage

Before starting the research, the author must first assess all of the variables in this study. The research preparation step is explained in the following way:

- a. Investigating the research problem
- b. Determining the research objective
- c. Choosing the research variables
- d. Conducting a literature review of scientific attitude, scientific literacy, and learning biotechnologys
- e. Creating research instruments: scientific attitude questioner, competency test, and questionnaire for attitude domain
- f. Validating the instruments with experts
- g. Revise the research instruments based on the judgement of experts and the validation results of students
- 2) Implementation Stage

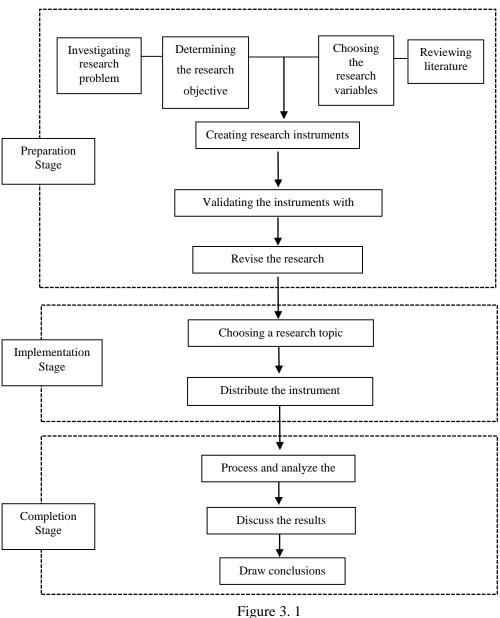

At this time, the author began gathering data through conducting research. The step of research implementation is explained as follows:

- a. Choosing a research topic
- b. Distribute the instrument (questionnaires and competency tests to private and public schools) after learning the topic of biotechnology
- 3) Completion Stage

The data collection was analyzed at this point. The research completion step is explained in the following points:

- a. Process and analyze the data
- b. Discuss the results based on the information obtained
- c. Draw conclusions based on the information obtained

The flowchart for this study is illustrated in Figure 3.1.
